

AI Conversation Summary - Velozient QA Automation Challenge

Purpose

This document summarizes how ChatGPT assisted during development of the Velozient QA Automation take-home project.

Project Setup

Created a Playwright + TypeScript project structure, Page Object Model, test organization, README guidance, and GitHub Actions CI/CD workflow.

UI Automation

Designed positive and negative booking scenarios, dynamic future date generation, retry logic for room availability, page object improvements, locator recommendations, and test refactoring.

API Testing

Created an example API test for booking creation using Playwright's request API with response validation.

Manual QA

Produced manual test cases (positive and negative) and formatted Markdown documentation.

Bug Reports

Helped document reproducible bug reports including generic validation messages and invalid booking date behavior.

Code Review

Reviewed repository structure and suggested improvements for readability, maintainability, naming, documentation, and CI.

README

Produced a professional README describing project overview, structure, execution, CI/CD, manual tests, bug reports, and AI usage.

Author Responsibility

All AI-generated suggestions should be reviewed, adapted, executed, and validated by the project author before submission.
